Page 2 of 19

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A reduction gear for a walking assistance system that, in order to assist walking movement by extending/bending a user's leg joint, reduces the speed of rotation of an input shaft (Si) driven by a motor (48) and transmits the rotation to an output shaft (So) connected to the leg joint, the reduction gear comprising:

the input shaft (Si), the output shaft (So), a first planetary gear mechanism (P_1), and a second planetary gear mechanism (P_2) disposed coaxially on an axis (L), the second planetary gear mechanism (P_2) being disposed so as to substantially overlap the radially outer side of the first planetary gear mechanism (P_1), the rotation of the input shaft (Si) being reduced in speed by the first planetary gear mechanism (P_1) and the second planetary gear mechanism (P_2) and transmitted to the output shaft (So);

the first planetary gear mechanism (P_1) comprising a first sun gear (ZS_1) provided on the input shaft (Si), a first ring gear (ZR_1) rotatably disposed so as to surround the outer periphery of the first sun gear (ZS_1) , a plurality of first planetary gears (ZP_1) meshing simultaneously with the first sun gear (ZS_1) and the first ring gear (ZR_1) , and a first carrier (C_1) rotatably supporting the first planetary gears (ZP_1) , and;

the second planetary gear mechanism (P_2) comprising a second sun gear (ZS_2) provided on the outer periphery of the first ring gear (ZR_1) , a second ring gear (ZR_2) disposed so as to surround the outer periphery of the second sun gear (ZS_2) , a plurality of second planetary gears (ZP_2) meshing simultaneously with the second sun gear (ZS_2) and the second ring gear (ZR_2) , and a second carrier (C_2) rotatably supporting the second planetary gears (ZP_2) ,

wherein the first carrier (C_1) of the first planetary gear mechanism (P_1) is fixed to a

casing (41), the second ring gear (ZR_2) of the second planetary gear mechanism (P_2) is fixed

to the casing (41), and the second carrier (C2) of the second planetary gear mechanism (P2) is

connected to the output shaft (So).

2. (Cancelled).

3. (Currently Amended) The reduction gear for the walking assistance system

according to Claim 2 Claim 1, wherein a third planetary gear mechanism (P₃) is disposed so

as to be coaxial with and be stacked on the first planetary gear mechanism (P₁) and the

second planetary gear mechanism (P₂) in the axis (L) direction, the third planetary gear

mechanism (P₃) comprising a third sun gear (ZS₃) provided on the outer periphery of a

central part of the second carrier (C₂) of the second planetary gear mechanism (P₂), a third

ring gear (ZR₃) fixed to the casing and disposed so as to surround the outer periphery of the

third sun gear (ZS₃), a plurality of third planetary gears (ZP₃) meshing simultaneously with

the third sun gear (ZS₃) and the third ring gear (ZR₃), and a third carrier (C₃) rotatably

supporting the third planetary gear (ZP₃) and connected to the output shaft (So).

4. (Withdrawn) A reduction gear for a walking assistance system that, in order to

assist walking movement by extending/bending a user's leg joint, reduces the speed of

rotation of an input shaft (Si) driven by a motor (48) and transmits the rotation to an output

shaft (So) connected to the leg joint, the reduction gear comprising:

the input shaft (Si), the output shaft (So), a first planetary gear mechanism (P₁), a

second planetary gear mechanism (P2), and a third planetary gear mechanism (P3) disposed

coaxially on an axis (L), the second planetary gear mechanism (P_2) being disposed so as to substantially overlap the radially outer side of the first planetary gear mechanism (P_1), the third planetary gear mechanism (P_3) being disposed so as to substantially overlap the radially outer side of the second planetary gear mechanism (P_2), the rotation of the input shaft (Si) being reduced in speed by the first planetary gear mechanism (P_1), the second planetary gear mechanism (P_2), and the third planetary gear mechanism (P_3) and transmitted to the output shaft (So);

the first planetary gear mechanism (P_1) comprising a first sun gear (ZS_1) provided on the input shaft (Si), a first ring gear (ZR_1) formed on the inner periphery of an inside ring member (55i) rotatably disposed so as to surround the first sun gear (ZS_1) , a plurality of first planetary gears (ZP_1) meshing simultaneously with the first sun gear (ZS_1) and the first ring gear (ZR_1) , and a first carrier (C_1) fixed to a casing (41) and rotatably supporting the first planetary gears (ZP_1) ;

the second planetary gear mechanism (P_2) comprising a second sun gear (ZS_2) formed on the outer periphery of the inside ring member (55i), a second ring gear (ZR_2) formed on the inner periphery of an outside ring member (55o) disposed so as to surround the outer periphery of the second sun gear (ZS_2) , a plurality of second planetary gears (ZP_2) meshing simultaneously with the second sun gear (ZS_2) and the second ring gear (ZR_2) , and a second carrier (C_2) fixed to the casing (41) and rotatably supporting the second planetary gears (ZP_2) ; and

the third planetary gear mechanism (P_3) comprising a third sun gear (ZS_3) formed on the outer periphery of the outside ring member (550), a third ring gear (ZR_3) fixed to the casing (41) so as to surround the outer periphery of the third sun gear (ZS_3) , a plurality of third planetary gears (ZP_3) meshing simultaneously with the third sun gear (ZS_3) and the

third ring gear (ZR₃), and a third carrier (C₃) rotatably supporting the third planetary gears

(ZP₃) and connected to the output shaft (So).

5. (Withdrawn) A reduction gear for a walking assistance system that, in order to

assist walking movement by extending/bending a user's leg joint, reduces the speed of

rotation of an input shaft (Si) driven by a motor (48) and transmits the rotation to an output

shaft (So) connected to the leg joint, the reduction gear comprising:

the input shaft (Si), the output shaft (So), a first planetary gear mechanism (P₁), a

second planetary gear mechanism (P₂), and a third planetary gear mechanism (P₃) disposed

coaxially on an axis (L), the second planetary gear mechanism (P₂) being disposed so as to

substantially overlap the radially outer side of the first planetary gear mechanism (P1), the

third planetary gear mechanism (P₃) being disposed so as to substantially overlap the radially

outer side of the second planetary gear mechanism (P2), the rotation of the input shaft (Si)

being reduced in speed by the first planetary gear mechanism (P1), the second planetary gear

mechanism (P2), and the third planetary gear mechanism (P3) and transmitted to the output

shaft (So);

the first planetary gear mechanism (P_1) comprising a first sun gear (ZS_1) provided on

the input shaft (Si), a first ring gear (ZR₁) fixed to a casing (41) so as to surround the first sun

gear (ZS_1) , a plurality of first planetary gears (ZP_1) meshing simultaneously with the first sun

gear (ZS₁) and the first ring gear (ZR₁), and a first carrier (C₁) rotatably supporting the first

planetary gears (ZP₁);

the second planetary gear mechanism (P₂) comprising a second sun gear (ZS₂) formed

on the outer periphery of the first carrier (C₁), a second ring gear (ZR₂) fixed to the casing

(41) so as to surround the outer periphery of the second sun gear (ZS₂), a plurality of second

planetary gears (ZP₂) meshing simultaneously with the second sun gear (ZS₂) and the second

ring gear (ZR₂), and a second carrier (C₂) rotatably supporting the second planetary gears

(ZP₂); and

the third planetary gear mechanism (P₃) comprising a third sun gear (ZS₃) formed on

the outer periphery of the second carrier (C₂), a third ring gear (ZR₃) fixed to the casing (41)

so as to surround the outer periphery of the third sun gear (ZS₃), a plurality of third planetary

gears (ZP₃) meshing simultaneously with the third sun gear (ZS₃) and the third ring gear

 (ZR_3) , and a third carrier (C_3) rotatably supporting the third planetary gears (ZP_3) and

connected to the output shaft (So).

6. (Withdrawn) A reduction gear for a walking assistance system that, in order to

assist walking movement by extending/bending a user's leg joint, reduces the speed of

rotation of an input shaft (Si) driven by a motor (48) and transmits the rotation to an output

shaft (So) connected to the leg joint, the reduction gear comprising:

the input shaft (Si), the output shaft (So), a first planetary gear mechanism (P₁), a

second planetary gear mechanism (P2), and a third planetary gear mechanism (P3) disposed

coaxially on an axis (L), the second planetary gear mechanism (P₂) being disposed so as to

substantially overlap the radially outer side of the first planetary gear mechanism (P₁), the

third planetary gear mechanism (P₃) being disposed so as to be stacked on the first planetary

gear mechanism (P₁) and the second planetary gear mechanism (P₂) in the axis (L) direction,

the rotation of the input shaft (Si) being reduced in speed by the first planetary gear

mechanism (P₁), the second planetary gear mechanism (P₂), and the third planetary gear

mechanism (P₃) and transmitted to the output shaft (So);

Docket No. 2830-0191PUS1

the first planetary gear mechanism (P_1) comprising a first sun gear (ZS_1) provided on the input shaft (Si), a first ring gear (ZR₁) fixed to a casing (41) so as to surround the outer periphery of the first sun gear (ZS₁), a plurality of first planetary gears (ZP₁) meshing

simultaneously with the first sun gear (ZS₁) and the first ring gear (ZR₁), and a first carrier

 (C_1) rotatably supporting the first planetary gears (ZP_1) ;

the second planetary gear mechanism (P_2) comprising a second sun gear (ZS_2) provided on the outer periphery of the first carrier (C_1) , a second ring gear (ZR_2) fixed to the casing (41) so as to surround the outer periphery of the second sun gear (ZS₂), a plurality of second planetary gears (ZP₂) meshing simultaneously with the second sun gear (ZS₂) and the second ring gear (ZR₂), and a second carrier (C₂) rotatably supporting the second planetary gears (ZP_2) ; and

the third planetary gear mechanism (P₃) comprising a third sun gear (ZS₃) provided on the outer periphery of a central part of the second carrier (C_2) , a third ring gear (ZR_3) fixed to the casing (41) so as to surround the outer periphery of the third sun gear (ZS_3), a plurality of third planetary gears (ZP₃) meshing simultaneously with the third sun gear (ZS₃) and the third ring gear (ZR₃), and a third carrier (C₃) rotatably supporting the third planetary gears (ZP₃) and connected to the output shaft (So).

7. (New) A reduction gear for a walking assistance system that, in order to assist walking movement by extending/bending a user's leg joint, reduces the speed of rotation of an input shaft (Si) driven by a motor (48) and transmits the rotation to an output shaft (So) connected to the leg joint, the reduction gear comprising:

the input shaft (Si), the output shaft (So), a first planetary gear mechanism (P₁), and a second planetary gear mechanism (P₂) disposed coaxially on an axis (L), the second

Page 8 of 19

planetary gear mechanism (P₂) being disposed so as to substantially overlap the radially outer

side of the first planetary gear mechanism (P₁), the rotation of the input shaft (Si) being

reduced in speed by the first planetary gear mechanism (P₁) and the second planetary gear

mechanism (P_2) and transmitted to the output shaft (So);

the first planetary gear mechanism (P₁) comprising a first sun gear (ZS₁) provided on

the input shaft (Si), a first ring gear (ZR₁) rotatably disposed so as to surround the outer

periphery of the first sun gear (ZS₁), a plurality of first planetary gears (ZP₁) meshing

simultaneously with the first sun gear (ZS₁) and the first ring gear (ZR₁), and a first carrier

 (C_1) rotatably supporting the first planetary gears (ZP_1) , and;

the second planetary gear mechanism (P_2) comprising a second sun gear (ZS_2)

provided on the outer periphery of the first ring gear (ZR₁), a second ring gear (ZR₂)

disposed so as to surround the outer periphery of the second sun gear (ZS₂), a plurality of

second planetary gears (ZP₂) meshing simultaneously with the second sun gear (ZS₂) and the

second ring gear (ZR₂), and a second carrier (C₂) rotatably supporting the second planetary

gears (ZP₂),

wherein the first planetary gear mechanism (P1) is sandwiched between the first

carrier (C_1) and the second carrier (C_2) .

8. (New) The reduction gear for the walking assistance system according to Claim 7.

wherein the first carrier (C₁) of the first planetary gear mechanism (P₁) is fixed to a casing

(41), the second ring gear (ZR₂) of the second planetary gear mechanism (P₂) is fixed to the

casing (41), and the second carrier (C₂) of the second planetary gear mechanism (P₂) is

connected to the output shaft (So).

9. (New) The reduction gear for the walking assistance system according to Claim 8.

wherein a third planetary gear mechanism (P₃) is disposed so as to be coaxial with and be

stacked on the first planetary gear mechanism (P₁) and the second planetary gear mechanism

(P₂) in the axis (L) direction, the third planetary gear mechanism (P₃) comprising a third sun

gear (ZS₃) provided on the outer periphery of a central part of the second carrier (C₂) of the

second planetary gear mechanism (P2), a third ring gear (ZR3) fixed to the casing and

disposed so as to surround the outer periphery of the third sun gear (ZS₃), a plurality of third

planetary gears (ZP₃) meshing simultaneously with the third sun gear (ZS₃) and the third ring

gear (ZR₃), and a third carrier (C₃) rotatably supporting the third planetary gear (ZP₃) and

connected to the output shaft (So).

10. (New) The reduction gear for the walking assistance system according to Claim 7,

wherein the first carrier (C_1) is part of a casing of the reduction gear.

11. (New) The reduction gear for the walking assistance system according to Claim 7,

wherein the first carrier (C_1) is non-rotatable.

12. (New) The reduction gear for the walking assistance system according to Claim 7.

wherein the first carrier (C_1) has a diameter larger than a diameter of the second carrier (C_2) .

13. (New) The reduction gear for the walking assistance system according to Claim 9,

wherein the first carrier (C_1) has a diameter larger than a diameter of the third carrier (C_3) .

14. (New) The reduction gear for the walking assistance system according to Claim 9,

wherein a quantity of first planetary gears (ZP₁) is greater than a quantity of second planetary

gears (ZP₂).

15. (New) The reduction gear for the walking assistance system according to Claim 7, is

enclosed in a casing that is substantially cylindrical in shape,

wherein the casing is formed by layering a first support ring, a second support ring, a

support plate, a motor housing, and a motor cover and integrally securing them with a

plurality of bolts.

16. (New) A reduction gear for a walking assistance system that, in order to assist

walking movement by extending/bending a user's leg joint, reduces the speed of rotation of

an input shaft (Si) driven by a motor (48) and transmits the rotation to an output shaft (So)

connected to the leg joint, the reduction gear comprising:

the input shaft (Si), the output shaft (So), a first planetary gear mechanism (P₁), and a

second planetary gear mechanism (P2) disposed coaxially on an axis (L), the second

planetary gear mechanism (P₂) being disposed so as to substantially overlap the radially outer

side of the first planetary gear mechanism (P₁), the rotation of the input shaft (Si) being

reduced in speed by the first planetary gear mechanism (P₁) and the second planetary gear

mechanism (P_2) and transmitted to the output shaft (S_0) ;

the first planetary gear mechanism (P_1) comprising a first sun gear (ZS_1) provided on

the input shaft (Si), a first ring gear (ZR₁) rotatably disposed so as to surround the outer

periphery of the first sun gear (ZS₁), a plurality of first planetary gears (ZP₁) meshing

simultaneously with the first sun gear (ZS₁) and the first ring gear (ZR₁), and a first carrier

 (C_1) rotatably supporting the first planetary gears (ZP_1) , and;

the second planetary gear mechanism (P₂) comprising a second sun gear (ZS₂)

provided on the outer periphery of the first ring gear (ZR₁), a second ring gear (ZR₂)

disposed so as to surround the outer periphery of the second sun gear (ZS₂), a plurality of

second planetary gears (ZP₂) meshing simultaneously with the second sun gear (ZS₂) and the

second ring gear (ZR₂), and a second carrier (C₂) rotatably supporting the second planetary

gears (ZP₂),

wherein the input shaft (Si), the first planetary gear mechanism (P₁), the second

planetary gear mechanism (P2), and the motor are completely enclosed in a cylindrical

casing.

17. (New) The reduction gear for the walking assistance system according to Claim

16, wherein the first carrier (C_1) of the first planetary gear mechanism (P_1) is fixed to a

casing (41), the second ring gear ($\mathbb{Z}R_2$) of the second planetary gear mechanism (\mathbb{P}_2) is fixed

to the casing (41), and the second carrier (C_2) of the second planetary gear mechanism (P_2) is

connected to the output shaft (So).

18. (New) The reduction gear for the walking assistance system according to Claim

17, wherein a third planetary gear mechanism (P₃) is disposed so as to be coaxial with and be

stacked on the first planetary gear mechanism (P₁) and the second planetary gear mechanism

(P₂) in the axis (L) direction, the third planetary gear mechanism (P₃) comprising a third sun

gear (ZS_3) provided on the outer periphery of a central part of the second carrier (C_2) of the

second planetary gear mechanism (P2), a third ring gear (ZR3) fixed to the casing and

disposed so as to surround the outer periphery of the third sun gear (ZS₃), a plurality of third

planetary gears (ZP₃) meshing simultaneously with the third sun gear (ZS₃) and the third ring

gear (ZR₃), and a third carrier (C₃) rotatably supporting the third planetary gear (ZP₃) and

connected to the output shaft (So).

19. (New) The reduction gear for the walking assistance system according to Claim 16,

wherein the first carrier (C_1) is part of a casing of the reduction gear.

20. (New) The reduction gear for the walking assistance system according to Claim 16,

wherein the first carrier (C_1) is non-rotatable.

21. (New) The reduction gear for the walking assistance system according to Claim 16,

wherein the first carrier (C_1) has a diameter larger than a diameter of the second carrier (C_2) .
